Introduction

The National Renal Advisory (NRAB) presents its third annual audit report of the New Zealand dialysis care standards. As in the past, the 2006 report incorporates data from the New Zealand Peritoneal Dialysis (NZ PD) Registry established and maintained by Assoc Prof John Collins at Auckland Hospital.

The Standards and Audit Subcommittee of the NRAB has not made any substantial changes in the data being reported. The collection and collation of data for this report is critically dependent on the goodwill and hard work of renal units and the staff of the Australian and New Zealand Dialysis and Transplant (ANZDATA) and NZ PD Registries.

Despite the work done with the Service Specification Project Team for the DHB Funding and Performance Directorate of the Ministry of Health last year the goal of having the dialysis care standards appended to the Tier Two Renal Service Specifications in the Ministry of Health's National Service Framework library has not been achieved. Further discussions between the MOH and the NRAB continue. The standards are available for review by health professionals and the public on the New Zealand Kidney Foundation website <http://www.nzkidneyfoundation.co.nz/>.

The section of the report incorporating data provided directly from renal units to the Subcommittee is again incomplete but some units are making a concerted effort to address this issue.

The Department of Nephrology at Christchurch Hospital provides support for the production of this report and I am again indebted to the help of Peter Dini, Systems Manager.

The process of data collection

The 2006 Report includes data from the 2006 ANZDATA and NZ PD Registry Reports and from some renal units' audit programmes. The timing of data collection and reporting for these two Registries means that the New Zealand Audit Report cannot be distributed until their work is completed in the second half of the year following original data collection. Once both Registries have complete unit data the reports of enquiries related to the New Zealand audit programme can be produced quickly.

The National Renal Advisory Board would appreciate feedback on this report. Comments can be sent to Johan Rosman, Chair of NRAB, JRosman@middlemore.co.nz or Kelvin Lynn, kelvin.lynn@cdhb.govt.nz

The audit data is shown in tabular and graphic form in the following pages. You may note minor changes in the data for 2004 and 2005 which result from corrections and updates to the ANZDATA and NZ PD databases.

Treatment modality of incident patients in New Zealand in 2006

Treatment modality of prevalent patients in New Zealand in 2006

Vascular access of prevalent HD patients in New Zealand at the end of 2004, 2005 & 2006 - percentage of AV fistulae

| Total HD | Northland | Auckland | Starship | Middlemore | Hamilton | Palm Nth | Taranaki | Wellington | Christchurch | Dunedin | New Zealand |
|----------|-----------|----------|----------|------------|----------|----------|----------|------------|--------------|---------|-------------|
| 2004 | 83 | 213 | 2 | 296 | 133 | 50 | 26 | 143 | 48 | 34 | 1028 |
| 2005 | 100 | 224 | 2 | 312 | 152 | 65 | 30 | 150 | 61 | 37 | 1133 |
| 2006 | 103 | 257 | 3 | 324 | 160 | 83 | 36 | 148 | 61 | 32 | 1207 |

Vascular access in prevalent New Zealand HD patients at the end of 2004, 2005 & 2006 - use of catheters
(Includes tunnelled and non-tunnelled catheters)

| Total Catheters | Northland | Auckland | Starship | Middlemore | Hamilton | Palm Nth | Taranaki | Wellington | Christchurch | Dunedin | New Zealand |
|-----------------|-----------|----------|----------|------------|----------|----------|----------|------------|--------------|---------|-------------|
| 2004 | 13 | 48 | 1 | 94 | 37 | 22 | 9 | 46 | 2 | 7 | 279 |
| 2005 | 18 | 46 | 0 | 82 | 40 | 29 | 10 | 39 | 4 | 7 | 275 |
| 2006 | 19 | 62 | 3 | 81 | 41 | 38 | 13 | 31 | 7 | 5 | 300 |

**Percentage of incident New Zealand HD patients starting HD with permanent vascular access in
2004, 2005 & 2006 - AV fistula or AV graft**

| Total HD | Northland | Auckland | Starship | Middlemore | Hamilton | Palm Nth | Taranaki | Wellington | Christchurch | Dunedin | New Zealand |
|----------|-----------|----------|----------|------------|----------|----------|----------|------------|--------------|---------|-------------|
| 2004 | 20 | 47 | 0 | 56 | 40 | 21 | 9 | 43 | 26 | 11 | 273 |
| 2005 | 26 | 50 | 1 | 48 | 45 | 24 | 7 | 44 | 25 | 9 | 279 |
| 2006 | 23 | 75 | 0 | 57 | 54 | 27 | 14 | 34 | 18 | 9 | 311 |

Percentage of non-late referred (<3 months) New Zealand HD patients starting HD with permanent access in 2004, 2005 & 2006- AV fistula or AV graft

| Total HD | Northland | Auckland | Starship | Middlemore | Hamilton | Palm Nth | Taranaki | Wellington | Christchurch | Dunedin | New Zealand |
|----------|-----------|----------|----------|------------|----------|----------|----------|------------|--------------|---------|-------------|
| 2004 | 15 | 32 | 0 | 47 | 21 | 11 | 5 | 34 | 23 | 6 | 194 |
| 2005 | 21 | 39 | 0 | 40 | 18 | 12 | 5 | 37 | 21 | 6 | 199 |
| 2006 | 14 | 60 | 0 | 49 | 27 | 16 | 8 | 24 | 12 | 7 | 217 |

Percentage of first PD catheters in New Zealand PD patients that are functioning at one year for 2004, 2005 & 2006

| Total Catheters | Northland | Auckland | Starship | Middlemore | Hamilton | Palm Nth | Taranaki | Wellington | Christchurch | Dunedin | New Zealand |
|-----------------|-----------|----------|----------|------------|----------|----------|----------|------------|--------------|---------|-------------|
| 2004 | 10 | 48 | 0 | 41 | 53 | 20 | NA | 43 | 18 | 13 | 246 |
| 2005 | 12 | 48 | 0 | 44 | 54 | 11 | 10 | 39 | 27 | 11 | 256 |
| 2006 | 20 | 59 | 0 | 40 | 67 | 15 | 8 | 35 | 24 | 13 | 281 |

Peritonitis rates in New Zealand PD patients (months/episode) for 2004, 2005 & 2006

| Total Patients | Northland | Auckland (inc Stars | Middlemore | Hamilton | Palm Nth | Taranaki | Wellington | Christchurch | Dunedin | New Zealand | |
|----------------|-----------|---------------------|------------|----------|----------|----------|------------|--------------|---------|-------------|-----|
| 2004 | 25 | 140 | | 94 | 193 | 49 | 23 | 122 | 61 | 35 | 742 |
| 2005 | 24 | 137 | | 98 | 182 | 40 | 22 | 124 | 64 | 30 | 721 |
| 2006 | 37 | 144 | | 110 | 192 | 37 | 22 | 118 | 69 | 35 | 764 |

Percentage of HD patients - Session Length (< 4.5h/session) for 2005 & 2006

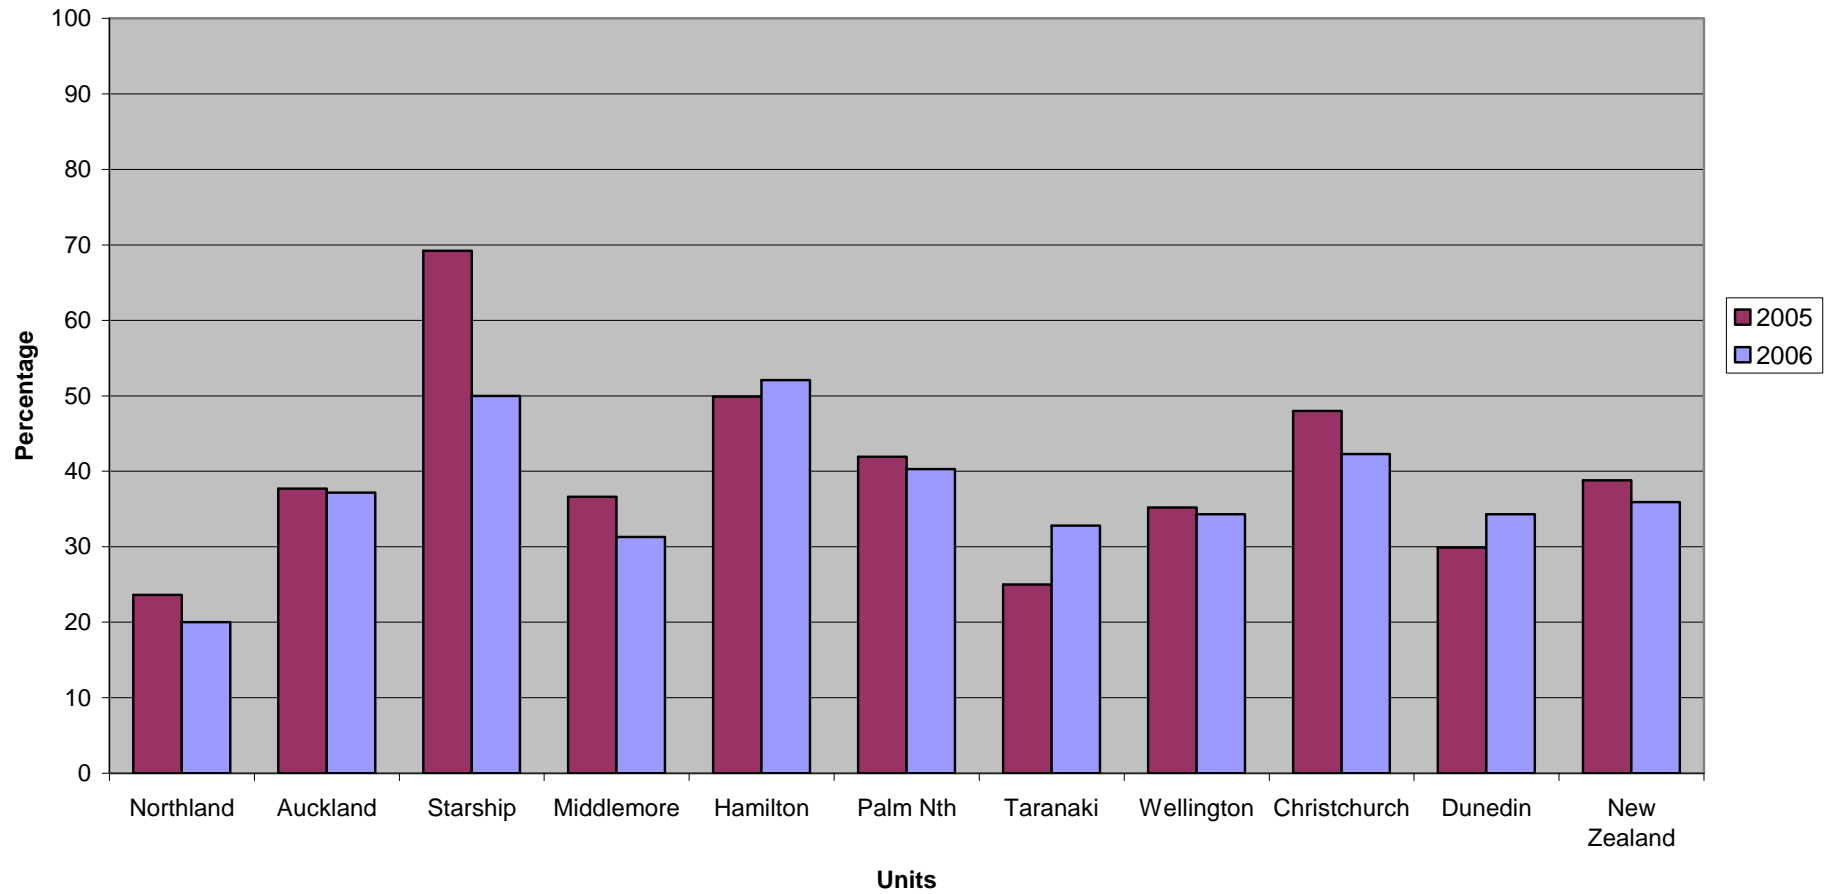

| Total Patients | Northland | Auckland | Starship | Middlemore | Hamilton | Palm Nth | Taranaki | Wellington | Christchurch | Dunedin | New Zealand |
|----------------|-----------|----------|----------|------------|----------|----------|----------|------------|--------------|---------|-------------|
| 2005 | 42 | 126 | 2 | 144 | 52 | 21 | 20 | 30 | 5 | 15 | 457 |
| 2006 | 36 | 100 | 1 | 117 | 36 | 19 | 15 | 18 | 5 | 10 | 357 |

Dialysis frequency and duration of session 2005 and 2006

| | Duration of dialysis treatment | | | | | |
|---------------------------|---------------------------------------|-------------|---------------------|-------------|--------------|-------------|
| Dialysis frequency | < 4 hours | | > 4 hours | | Total | |
| | 2005 | 2006 | 2005 | 2006 | 2005 | 2006 |
| < 3/week | 3 | 3 | 18 | 14 | 21 | 17 |
| 3 x weekly | 32 | 27 | 1,010 | 1,080 | 1,042 | 1,107 |
| > 3/week | 16 | 18 | 54 | 65 | 70 | 83 |
| Total | 51 | 48 | 1,082 | 1,159 | 1,133 | 1,207 |

Percentage of dialysis patients with Hb Concentration (< 110g/l) at end of 2005 & 2006

| Total Patients | Northland | Auckland | Starship | Middlemore | Hamilton | Palm Nth | Taranaki | Wellington | Christchurch | Dunedin | New Zealand |
|----------------|-----------|----------|----------|------------|----------|----------|----------|------------|--------------|---------|-------------|
| 2005 | 29 | 132 | 9 | 150 | 166 | 44 | 13 | 96 | 60 | 20 | 719 |
| 2006 | 28 | 146 | 6 | 136 | 155 | 48 | 19 | 91 | 55 | 23 | 707 |

Extract from the 2006 New Zealand Peritoneal Dialysis Registry Report

Section 1. Peritoneal catheter survival

(Audit standard - >80% of first PD catheters functioning at 1 year.)

Peritoneal catheter insertions were not included in this analysis if the following occurred in the first year: the patient died with the catheter in situ, the patient recovered renal function and discontinued PD, the patient was transplanted or the patient was lost to follow up.

(shaded box = standard not achieved)

Commentary

Demography

- There continues to be a substantial variation between units in regard to initial and prevalent dialysis modality; particularly in the proportion of patients on centre dialysis.
- The number of incident patients continues to rise annually.
- The numbers of prevalent haemodialysis and peritoneal dialysis patients both increased in 2006.

Haemodialysis adequacy, frequency and duration of treatment

- There has been a fall in the number of haemodialysis patients receiving less than 4.5 hours dialysis per session from 457 (40%) to 357 (38%, when compared to 2005).
- Twenty-four patients on thrice weekly dialysis are receiving less than 4 hours dialysis for each treatment session: a substantial reduction in patient number compared to 2005.

Vascular access for haemodialysis

- **Eight of ten units** again achieved the standard for optimal vascular access (arteriovenous (AV) fistula + graft) for prevalent patients but **none** for incident patients or the more stringent standard for non-late presenting patients.
- There has been an increase in the number of prevalent haemodialysis patients using a central venous catheter (CVC) for dialysis and **no renal unit** has <10% of their patients using this form of vascular access. At 31 Dec 2006, 300 haemodialysis patients (25% of all New Zealand haemodialysis patients) were using a CVC for vascular access with the range being 12 to 46% of haemodialysis patients across units.
- A significant proportion of patients who received haemodialysis for up to 90 days before starting on peritoneal dialysis used a CVC. There is no way from the Registry data to

know whether there was an intention during the pre-dialysis phase of care that peritoneal dialysis would be the starting treatment modality. In 2006, there were 72 such patients who had up to 90 days haemodialysis before changing to peritoneal dialysis and **all but two** had a CVC as vascular access. Thirty-one of these patients (43%) were late presenters.

- The continuing high rates of CVC use in some units are of concern because of the evidence that patient survival is inferior with this form of access when compared with an AV fistula. Although the data are sparse, it appears that the rates of blood stream infections related to CVCs are well within the international recommendations.
- Disappointingly, the current audit results in regard to vascular access do not provide any reassurance that there have been substantial changes in the co-ordination of, and capacity to provide, timely vascular access. This indicates a problem with the predialysis co-ordination of vascular access services and requires a multidisciplinary approach to finding a solution. A recent analysis of haemodialysis vascular access from ANZDATA for 2000 to 2005 also notes a decline in the use of arteriovenous fistulae and an increase in CVC use for incident and prevalent patients¹.

Peritoneal dialysis

- The number of first peritoneal dialysis catheters functioning at year end continues to be excellent with all units achieving the standard.
- Peritonitis rates vary considerably. Four units either achieve or are very close to the standard of at least 18 patient months/episode of peritonitis. Units with a large proportion of Maori and Pacific patients have inferior results (see the 2005 report for more in depth analysis)

Anaemia management

- Dialysis patients with the anaemia of chronic renal failure and a haemoglobin concentration < 100g/L are entitled to receive subsidised epoietin. Many units have revised their treatment target to 100 – 120 g/L in the light of recent publications examining the risks of a higher treatment target, particularly in patients with cardiac disease^{2,3} and on consideration of Clinical Practice Guidelines⁴.
- The proportion of dialysis patients with a haemoglobin concentration < 110g/L in 2006 fell to 36% (707 patients). In the light of the alteration in treatment target it may be useful to report the number of patients with a haemoglobin concentration < 100g/L in the next report.

Data provided by renal units

- Waiting times for the provision of arteriovenous fistulae varies amongst the four units that provided data. This audit standard has been difficult to report on as the nature of referral to a vascular surgeon varies, the rate of progression of kidney disease may slow after referral and, in some cases, the patient has asked for a deferment of surgery.
- Four units provided data on dialysis catheter related blood stream infections and all had rates < 4/1000 catheter days.
